

# API Calls

---

1405

Instructor: Ruiqing (Sam) Cao

# Required Python Libraries for Today

Main libraries: json, requests, csv, BeautifulSoup (bs4), pyjsonviewer

```
import requests
from bs4 import BeautifulSoup
import pyjsonviewer
import json
import csv
```

Recurring libraries (we'll see a lot more of later):  
numpy, pandas, matplotlib

```
import numpy as np
import pandas as pd
from matplotlib import pyplot as plt
```

If a **module** is not yet installed, you can type `%pip install module` inline in your Jupyter Notebook to install it

# Application Programming Interface (API)

---

- Application Programming Interface (API): an ***interface*** that is used to connect two pieces of software programs

# Application Programming Interface (API)

---

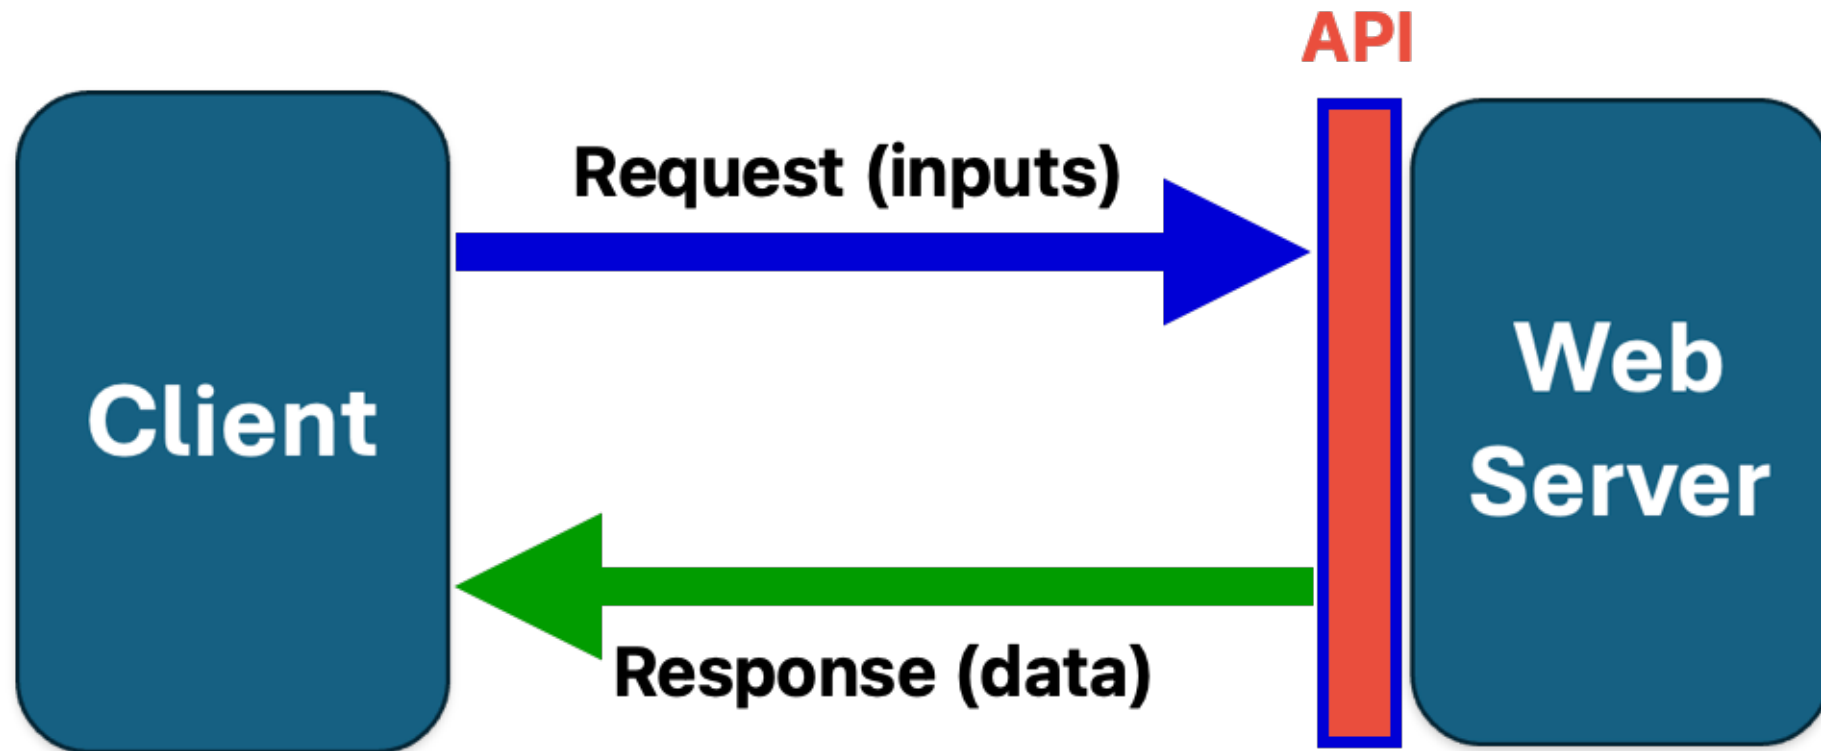

- Application Programming Interface (API): an ***interface*** that is used to connect two pieces of software programs

- An API is designed to *open up a software system*, allowing outside agents to interact with it, by *exchanging data according to a set of defined rules* (written in the API)

# API calls

---

# API requests: GET() and POST()

---

- APIs are like glues between two different software applications (e.g., you the **client** and an Internet-based **service**), so that they can communicate and exchange data
- The client sends an API call (*request*) to the web service through the Internet, and receives a *response* from the web service
- The client can also *send* data to the web service, and not only *receive* data from the web service
- Let's learn more about this using exercises from a real API...

# APIs

---

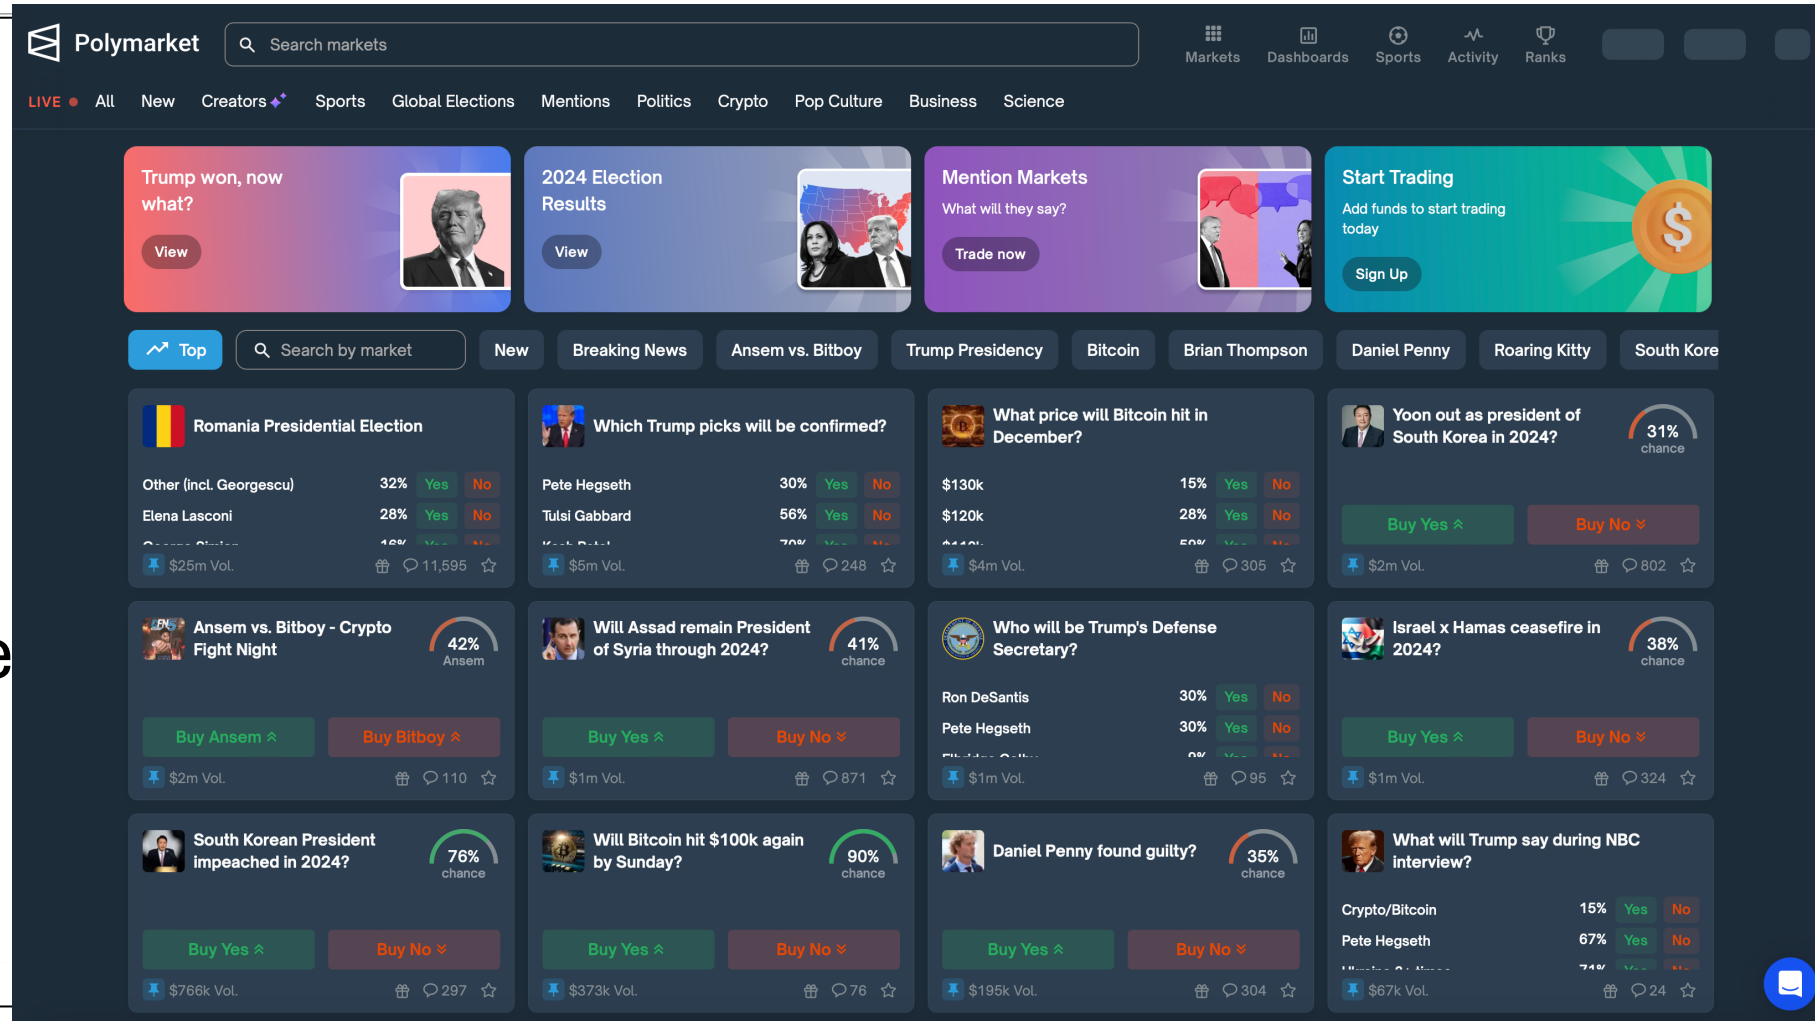

- Query string: URL ? (start of the query)  
parameter=value&param2=value2
- REST API calls typically return JSON objects. This simpler than HTML/XML files to work with. Both are semi-structured data.

# Polymarket: World's largest prediction market

# 2020

- Launched 2024

- Raised US\$70 million in two funding rounds
- ~200,000 active traders, over \$500 million trading volume

# Prediction Markets

- Prediction market: a speculative market designed so ***prices can be interpreted as probabilities*** of a future event and used to make predictions
- Traders with superior information about a certain future event can profit from their knowledge by betting correctly on the outcome (binary) of that event

# How Polymarket Works

---

- Traders can buy and sell shares representing a future event's outcome (e.g., “Who will win the 2024-25 UEFA Champions League?”)
- The price  $p$  is always a number between 0 and 1, and you can buy “YES” for  $p$  or “NO” for  $1-p$  per share
- Shares representing the correct final outcome are paid out \$1 USD each share after the event's outcome is realized

# How Polymarket Works

---

- Markets are created out of all kinds of events: most popular in sports and politics, but also in pop culture and business (e.g., “Will OpenAI become for-profit before April 2025?”)
- Market internalizes the superior knowledge or information that some traders may have about an event that others don’t have, which in aggregate are reflected in the **prices**
- Prediction markets provides an alternative to polls and expert opinions for predicting outcomes of major events, by aggregating information into a single price that represents the market's view

# Polymarket API

---

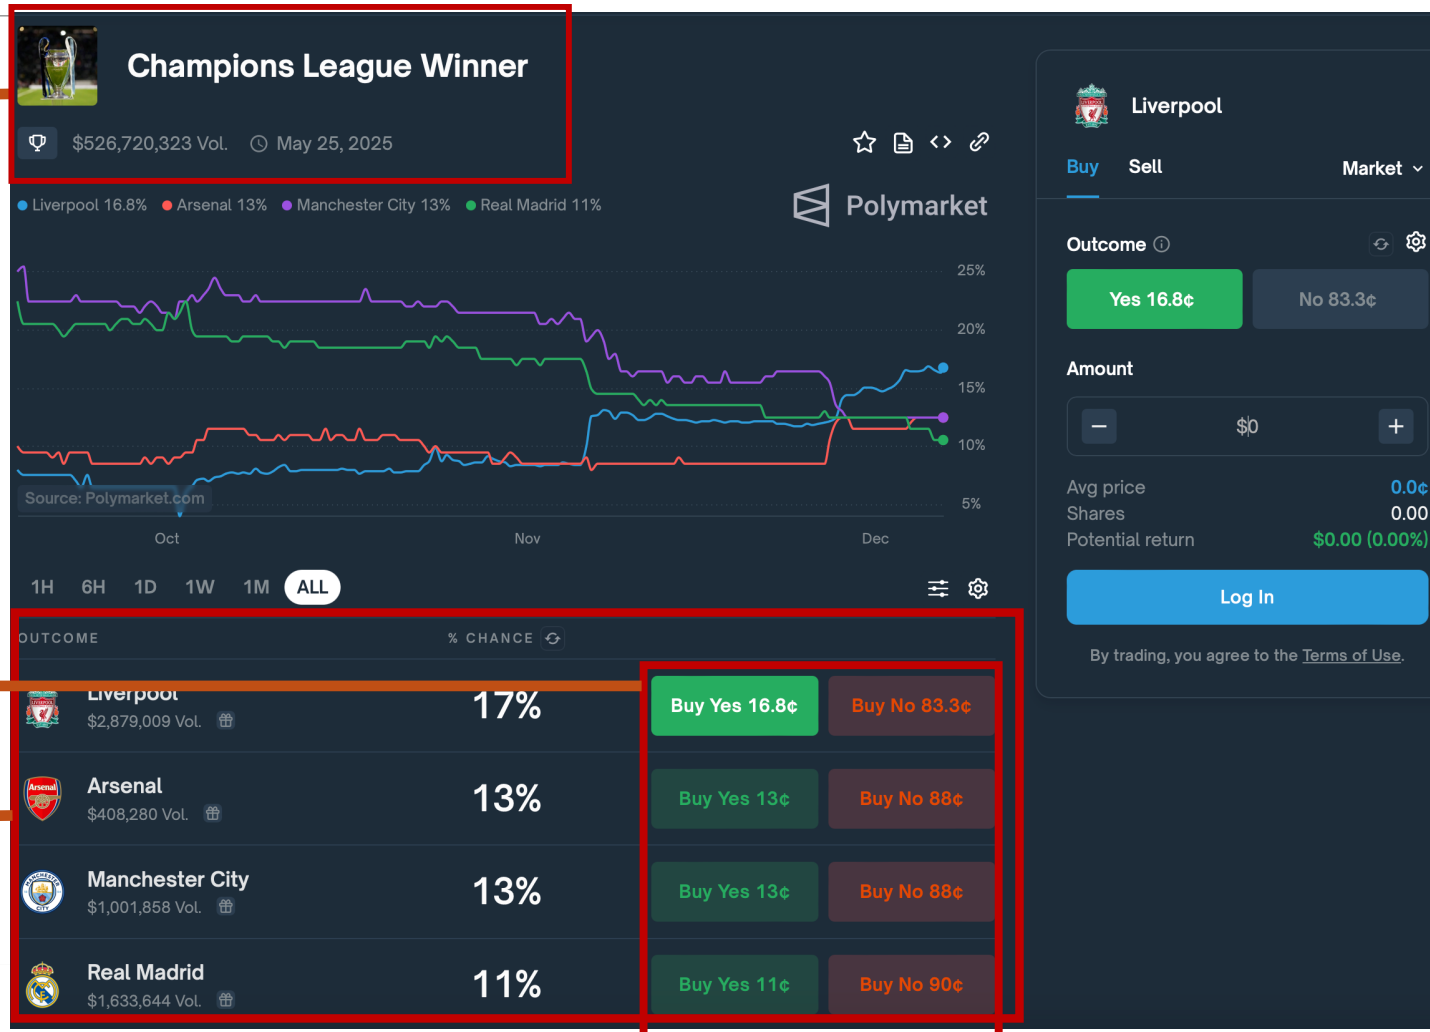

- Polymarket offers an API that allows public access to its events, markets, and historical prices. We will use its API as an example to show how to collect data by calling an API

Check the **API documentation** first: Human-readable instructions

- Available endpoints, methods, authentication protocols, parameters, etc.
  - Sometimes examples of common requests and responses
- 
- Extremely useful for getting started with a new API and for building the correct queries to retrieve the needed data

# Who will win the UEFA Champions League?

Event

Prices

Markets

# Who will win the UEFA Champions League?

---

There are multiple possible outcomes of **event** “winner of 2024-25 UEFA Champions League”, each associated with a distinct **market**

There are 36 *markets* under the title event, for example, one of them is “Will **Liverpool** win the UEFA Champions League in 2024-25?”

Each market is associated with a different team that can be a potential winner: for example, **Liverpool**, **Arsenal**, **Manchester City**, and **Real Madrid** are currently the top teams projected as possible winners, so they each has a distinct market where traders can buy or sell shares

# Polymarket API

---

For the assignment you may need to install the Python client for the Polymarket CLOB, by typing the following

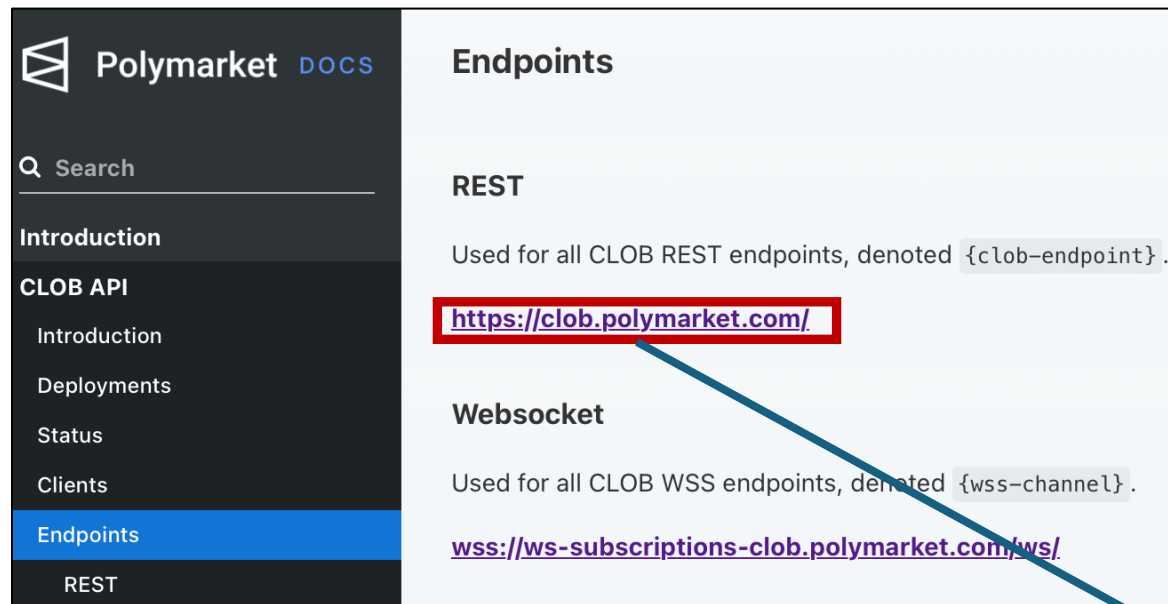

```
>> %pip install py-clob-client
```

Look for the following in the API documentation:

- Endpoints
- Request method (e.g., GET or POST)
- Query parameters
- Example queries

# Polymarket API: Endpoint

## CLOB API endpoints

**Polymarket DOCS**

Search

Introduction

**CLOB API**

Introduction

Deployments

Status

Clients

**Endpoints**

REST

### Endpoints

#### REST

Used for all CLOB REST endpoints, denoted `{clob-endpoint}`.

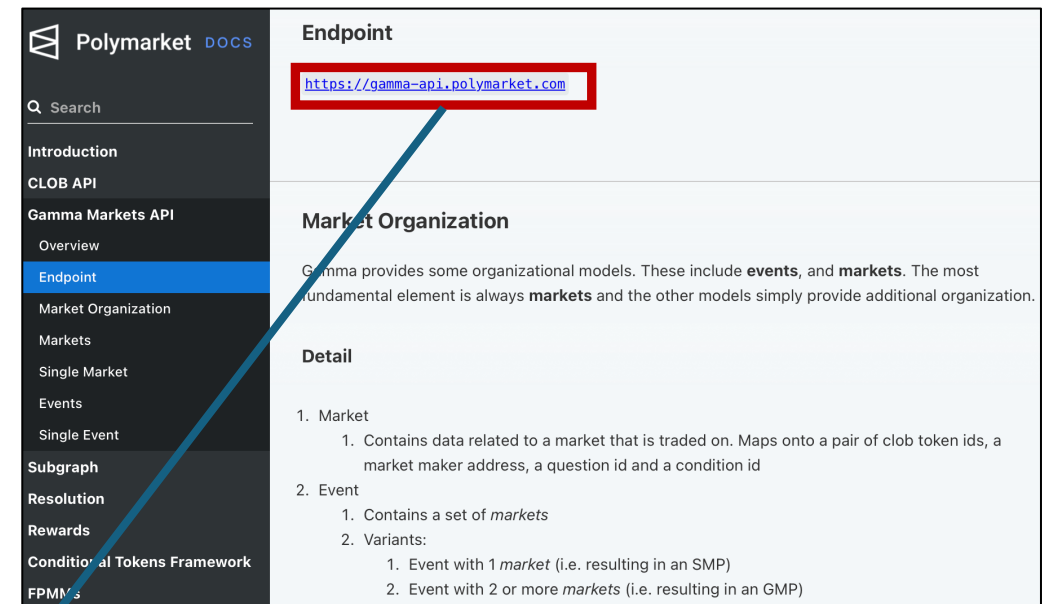

<https://clob.polymarket.com/>

#### Websocket

Used for all CLOB WSS endpoints, denoted `{wss-channel}`.

<wss://ws-subscriptions-clob.polymarket.com/ws/>

## Gamma Markets API endpoints

**Polymarket DOCS**

Search

Introduction

**CLOB API**

**Gamma Markets API**

**Endpoint**

Market Organization

Markets

Single Market

Events

Single Event

**Subgraph**

Resolution

Rewards

Conditional Tokens Framework

FPMs

### Endpoint

<https://gamma-api.polymarket.com/>

#### Market Organization

Gamma provides some organizational models. These include **events**, and **markets**. The most fundamental element is always **markets** and the other models simply provide additional organization.

#### Detail

1. Market
  1. Contains data related to a market that is traded on. Maps onto a pair of clob token ids, a market maker address, a question id and a condition id
2. Event
  1. Contains a set of *markets*
  2. Variants:
    1. Event with 1 *market* (i.e. resulting in an SMP)
    2. Event with 2 or more *markets* (i.e. resulting in an GMP)

**Endpoint:** URL (web address) that provides the location of the resource to which the API requests should be sent

# Polymarket API: GET Method & Base URL

The screenshot shows the Polymarket API documentation for the Markets endpoint. The left sidebar contains a navigation menu with items: Introduction, CLOB API, Gamma Markets API (selected), Overview, Endpoint, Market Organization, Markets, HTTP Request, Query Parameters, Example Queries, Example Response Format, Single Market, Events, and Single Event. The main content area is titled 'Markets' and includes the text 'Get markets.' and a note: 'Note: Markets can be traded via the CLOB if `enableOrderBook` is `true`.' Under the 'HTTP Request' section, the URL `GET {gamma-endpoint}/markets` is highlighted with a red box. Below this is a 'Query Parameters' table.

Name	Type	Description
limit	number	limit query results
offset	number	pagination offset
order	string	key to sort by
ascending	boolean	sort direction, defaults to true, requires the 'order' parameter
id	number	id of a single market to query, can be used multiple times to fetch multiple markets

The screenshot shows the Polymarket API documentation for the Single Event endpoint. The left sidebar contains a navigation menu with items: HTTP Request, Query Parameters, Example Queries, Example Response Format (selected), Single Event, and Events. The main content area is titled 'Single Event' and includes the text 'Get a single event by id.' Under the 'HTTP Request' section, the URL `GET {gamma-endpoint}/events/{id}` is highlighted with a red box.

Recall that {gamma-endpoint} is  
<https://gamma-api.polymarket.com>  
from the last slide

**GET:** Send API calls using the GET method and format the base URL using the specified format under HTTP Request

# Polymarket API: Query Parameters

 Polymarket DOCS

Introduction

CLOB API

Gamma Markets API

Overview

Endpoint

Market Organization

Markets

HTTP Request

Query Parameters

Example Queries

Example Response Format

Single Market

Events

Single Event

## Markets

Get markets.

*Note: Markets can be traded via the CLOB if `enableOrderBook` is `true`.*

**HTTP Request**

```
GET {gamma-endpoint}/markets
```

**Query Parameters**

Name	Type	Description
limit	number	limit query results
offset	number	pagination offset
order	string	key to sort by
ascending	boolean	sort direction, defaults to true, requires the <code>order</code> parameter
id	number	id of a single market to query, can be used multiple times to fetch multiple markets

## Events

HTTP Request

Query Parameters

Example Queries

Example Response Format

Single Event

## Single Event

Get a single event by id.

**HTTP Request**

```
GET {gamma-endpoint}/events/{id}
```

**Query parameters:** Some of them are optional, or take default value if unspecified (e.g., `limit=20`), format is `"?param1=value1&param2=value2"` after the base URL

# Polymarket API: Putting It All Together

Two approaches –

**Any problems?**

Get data for a single event (send event ID)

Events

HTTP Request

Query Parameters

Example Queries

Example Response Format

Single Event

## Single Event

Get a single event by id.

### HTTP Request

```
GET {gamma-endpoint}/events/{id}
```

Get data for all the markets (by sending market IDs)

# Polymarket API: Plot Current Prices

Plot the current projected winning probabilities (prices) of all teams

3. Plot the data.

# Exercise: Polymarket API Queries

---

Your task is to collect specific data using Polymarket's APIs. For each scenario, identify the appropriate API endpoints and the necessary query parameters.

1. Retrieve market information for the top five FIFA World Cup teams in 2026 (with the highest current predicted winning probabilities). Hint: Determine which API endpoint provides market details and how to filter results for specific teams.
2. Retrieve up to 5 events tagged with "Grammys". Hint: Use the endpoint that allows event searches by tag. Key Parameter: Use tag\_id=924 for Grammys-related events. Configure the API call to return no more than 5 results.
3. Collect the historical price data for the event: Spain winning the 2026 FIFA World Cup. Hint: Identify the endpoint that provides historical price data.
